

Okay so,

You wanna play Relapse Resistance, huh?

Well, here's the bad news... It isn't simple to do. However, if you're persistent, and willing to spend some time, you too can play Relapse Resistance.

Also, **DISCLAIMER**, you're trying everything at your own risk.

While jailbreaking a device and uploading the game to it is relatively simple, there is always a chance of hurting your device during the process. Don't sue me if you fuck up, I'm broke anyway so you wouldn't get much out of me.

Here's now a special bit of info written by the incredible sexy Hunter...

The iPhone 4s looks like the golden goose. Maxes out at iOS 7 and you can downgrade to iOS 6, 5, or 4 untethered using Legacy iOS Kit (powdersn0w) Only iPhone3,1 (GSM) and iPhone3,3 (CDMA) are supported.

https://www.youtube.com/watch?v=kLp_M_BT3sY

The iPhone 5 (not 5c) can downgrade to iOS 8.4.1 - we don't know if Relapse works on that iOS yet.

https://www.reddit.com/r/iOSDowngrade/comments/jlx7iv/downgrade_and_duaboot_status_of_almost_all_ios/

<https://github.com/LukeZGD/Legacy-iOS-Kit/wiki/Restore-Downgrade>

So, with all that being said... let's get into it bitches.

STEP 1 - A DEVICE

Okay, so first things first, you're gonna need a device to play the game on. There are multiple devices that can work for the game, however there are some important things to keep in mind.

The devices should be iOS 7 or sooner, as the game doesn't run properly, if at all, on iOS 8 or later. I've heard some people have had luck with iOS 8, however iOS 7 and sooner is your safest bet, and is sure to work.

I also suggest using between iOS 4 and iOS 7, as 3 was a lot of hassle for me personally. However, this hassle was ultimately because iOS 3 had a lot of compatibility issues with apps when it got to the screen recording section. As such, you may find a lot of apps unable to run on a iOS 3 device, just because it's an early iOS.

If you do not currently own a device, or you want to get a brand new device to fuck around with, then I highly suggest *Elite Obsolete Electronics*. EOE is one of the best when it comes to cheap, refurbished Apple goods, and the best to ensure you're purchasing quality goods.

<https://eoe.works/>

Hunter wanted me to add that you should make sure your devices are **UNTETHERED**. I'm not sure how to check that, but Hunter wanted it added to this guide, so here you fucking go Hunter.

STEP 2 - DOWNGRADING & JAILBREAKING

Use the website below to select your target iOS type that you intend to use for your jailbreak. Make sure that the iOS you want is able to run on your device.

(IPSW files are just the file formats for each individual iOS update.)

<https://ipsw.me/>

The website will help you find the file you need, just follow the steps it gives you and you'll get be chillin'.

Now, jailbreaking is something that can be achieved numerous different ways. And another, more noob-friendly way to go is with redsn0w.

Redsn0w is a full-fledged computer application with simple-to-follow, real time instructions on jailbreaking. While I personally enjoyed LukeZGD's kit more, this application simplifies the entire jailbreaking process and is probably a better option if you're going into this blind.

It's important to know that this option did not work for me, but that was no fault of the app itself. My device was just pooppy butt water. Btw, it's only on PC. Probably should've said that sooner lolololol

<https://theapplewiki.com/wiki/Redsn0w>

If redsn0w doesn't work, or you're a little more knowledgeable on the process, I suggest using LukeZGD's application, which is what I used for my video. Please note that doing this **will delete all personal contents on the phone**.

Again, the application will walk you through the process.

<https://github.com/LukeZGD/Legacy-iOS-Kit>

To check if your jailbreak is working, make sure you have an app installed named "Cydia". Cydia is the jailbreaking app that allows all the cool shit to happen.

If both of these options fail you, then you'll have to do some digging into what exactly is going wrong. However, these 2 apps should work for you if you follow all the instructions.

If you have any questions, reach out to the r/Jailbreak Discord server. That goes for if you're having trouble with any of the steps here. Although don't be annoying because I don't want them to be mad at me for including them in this tutorial lmao.

<https://discord.gg/jb>

Step 3 - The App

Okay, so you got the device jailbroken. Huge congrats, that literally took me 4 hours to do. How long did it take you? I don't really care to be honest. Let's install the app!

Get on the Cydia application, and download AppSync by visiting the URL below.

<https://cydia.invoxplaygames.uk/ios3/>

If you're unsure how to visit this link using Cydia, here's a good YouTube tutorial on how to do it.

MAKE SURE YOU USE THE LINK I PUT ABOVE, NOT THE LINK HE USES IN HIS VIDEO. THIS LINK MAY CHANGE DOWN THE LINE AND IF IT DOES, YOU MADE NEED TO FIND A NEW LINK TO GET APPSYNC ON YOUR OWN.

<https://www.youtube.com/watch?v=S2yBWK6SR1o>

After ensuring AppSync is on your device, it's time to load the game onto your phone.

Start by downloading the Relapse Resistance iPA file from archive.org. Also, archive this download in case the cease-and-desist letters get this link removed.

<https://archive.org/details/relapse-1.0.0>

There are 2 apps you can use to achieve this goal.

The first one is what I used, and is called AppManager.

<https://github.com/kawaiizenbo/AppManager/releases/>

The second one is SideLoadly, and is much more commonly used. The only reason I didn't use this is because Chrome blocked it from downloading and I was too lazy to go into my settings.

<https://sideloadly.io/>

These 2 apps are very simple to use, and will walk you through the entire process. Just simply plug in your phone, use the application, and you should succeed in your endeavor.

Assuming you did everything correct, you should now have the ability to play Relapse Resistance. On top of that, you now have a jailbroken device which you can upload applications to.

Here are a few repositories full of iPA files. Please note that not every app will work with your selected iOS, especially the lower ones.

<https://archive.org/details/ipaarchive>

<https://iosninja.io/ipa-library-ios>

<https://archive.org/download/iOS0bscura>

If you've had trouble at any point in this process, or are not able to complete any of these steps, here are a few more places you can get extra help, or even completely separate suggestions from what I've given here. I'm kinda dumb so there's a firm chance I led you incorrectly lol.
